

Develop a python script

Team ID	PNT2022TMID47771
Project Name	Smart waste management system for metropolitan cities

Step 1: Open python idle

Step2: Type the program

Step 3: Then click on file and save the document

Step 4: Then click on Run then Run Module

Step 5: output will be appeared in the idle window

Python script

```
import requests
import json
import ibmiotf.application
import ibmiotf.device
import time
import random
import sys
```

```
# watson device details
```

```
organization = "2tllwl"
devicType = "BIN1"
deviceId = "BIN1ID"
authMethod= "token"
authToken= "123456789"
```

```
#generate random values for randomo variables (temperature&humidity)
```

```

def myCommandCallback(cmd):
    global a
    print("command recieved:%s" %cmd.data['command'])
    control=cmd.data['command']
    print(control)

try:
    deviceOptions={"org": organization, "type": devicType,"id": deviceId,"auth-method":authMethod,"auth-
token":authToken}
    deviceCli = ibmiotf.device.Client(deviceOptions)
except Exception as e:
    print("caught exception connecting device %s" %str(e))
    sys.exit()

#connect and send a datapoint "temp" with value integer value into the cloud as a type of event for every 10 seconds
deviceCli.connect()

while True:

    distance= random.randint(10,70)
    loadcell= random.randint(5,15)
    data= {'dist':distance,'load':loadcell}

    if loadcell < 13 and loadcell > 15:
        load = "90 %"

    elif loadcell < 8 and loadcell > 12:
        load = "60 %"

    elif loadcell < 4 and loadcell > 7:
        load = "40 %"
    else:

```

```

else:
    dist = 'Risk warning:' '17 %'

if load == "90 %" or distance == "90 %":
    warn = 'alert :' ' Dumpster poundage getting high, Time to collect :)'

elif load == "60 %" or distance == "60 %":

    warn = 'alert :' 'dumpster is above 60%'
else :
    warn = 'alert :' 'No need to collect right now '
def myOnPublishCallback(lat=10.678991,long=78.177731):
    print("Gandigramam, Karur")
    print("published distance = %s " %distance,"loadcell:%s " %loadcell,"lon = %s " %long,"lat = %s" %lat)
    print(load)
    print(dist)
    print(warn)

time.sleep(10)

success=deviceCli.publishEvent ("IoTSensor","json",warn,qos=0,on_publish= myOnPublishCallback)

```

```
success=deviceCli.publishEvent ("IoTSensor","json",data,qos=0,on_publish= myOnPublishCallback)
```

```
if not success:
```

```
    print("not connected to ibmiot")
```

```
time.sleep(30)
```

```
    deviceCli.commandCallback=myCommandCallback
```

```
#disconnect the device
```

```
deviceCli.disconnect
```

Screenshots Python script:

The image shows a Windows desktop with three instances of the Python 3.7.4 IDLE environment. Each window displays the same Python script, which simulates an IoT device connected to a Watson IoT platform. The script includes the following components:

- Imports:** `requests`, `json`, `ibmiotf.application`, `ibmiotf.device`, `time`, `random`, and `sys`.
- Device Details:** A dictionary containing organization, deviceType, deviceId, authMethod, and authToken.
- Data Generation:** A `while True` loop that generates random values for distance and load, and sends a datapoint to the cloud via `deviceCli.connect()`.
- Command Handling:** A `myCommandCallback` function that prints received commands and controls.
- Alerts:** The script receives and prints risk warnings from the cloud, such as "Risk warning: Dumpster is above 60K".

The console output in the bottom window shows the device details, the generation of random values, and the receipt of a risk warning. The status bar at the bottom of the window indicates the file path and line numbers.
